## Clayson Williams EYE CENTER

Dr. Fred Clayson is pleased to announce his partnership with Dr. Brice Williams at the Clayson-Williams Eye Center. He specializes in cataract surgery, plastic surgery of the eyelids and Lasik, using the most current equipment and techniques. His specialty training also includes treatment of macular degeneration. His research in the field of macular degeneration has been presented at scientific forums on the subject. Dr. Williams also treats other ocular medical conditions, including diabetes and glaucoma.

We are please to have a physician in our clinic with Dr. Williams' background and training and look forward to his excellent quality of patient care.

# LASIK

## GET THE RESULTS

Before you have a vision correction procedure done on something as valuable as your eyes, you surely want to know the difference between the lowest price LASIK procedure and the CORRECT CUSTOMIZED procedure for your particular vision needs. Standard LASIK may be all is necessary for your individual vision correction, but if your vision correction requires custom LASIK, then we have two exclusive high tech options from which you may choose. Call the Clayson Williams Eye Center today and schedule a **FREE CONSULTATION** to find out which standard or custom vision correction procedure is right for you.

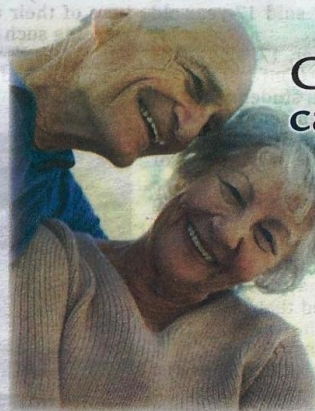

Get all the answers to your LASIK vision correction questions and know that your getting the **correct LASIK procedure** . . . not the cheapest.

Year End Special  
Expires 12/31/12

**\$1650 per eye**

## Don't Miss Seeing the Future You Have Built

Get a **FREE** cataracts screening!

Frequently, as a result of aging, the natural lens of the eye becomes clouded. This clouding is called a cataract. Cataract removal has become routine outpatient surgery with a 95% success rate. It is one of the most successful surgeries performed today. With such a high success rate, **don't let cataracts blur the future you worked so hard to build.**

### HOW DO I KNOW IF I HAVE CATARACTS?

- Vision is blurred or fuzzy
- Eyes are sensitive to light and glare
- Colors appear faded
- Reading or see objects at close range becomes difficult
- Driving at night becomes difficult
- Newspaper or magazine print runs together or is blurred
